

## Rhinoplasty (Nosejob)

A person's nose being the center of the face, is one of the most important facial feature that draws one's own as well as other people's attention.

A bulky, crooked, wide, long, bumpy, epressed or prominent nose can be a reason for extreme self-consciousness of one's body image.

A nose with deviated septum may also lead to breathing difficulties.

These problems can be addressed with single Rhinoplasty procedure.

Most of the surgery is performed from the incisions that are hidden away inside the nostrils.

## Medspa

Face is the first thing that people notice about any person. While it is not the only part of your personality, good facial features are highly desired among our clients across all age groups.

In this ever-advancing world of technology, the importance of good facial aesthetics is being realized from a very early age owing to multiple occasions of socializing that ranges from a simple selfie to grand scale events like weddings, parties, seminars, or even virtual video conferencing.

## Facial Features Desired By Our Clients Are,

Wrinkle-less forehead

Healthy and younger looking clear skin with no crow's feet, dark circles, moles, and scars.

Perfect eyebrows and eyelid skin

A well-proportioned and perfect nose

Fuller lips | Dimpled cheeks

Well-defined jawline | Perfect smile

A well-shaped chin

A natural-looking hairline with dense hair growth

An overall younger looking face with no signs of ageing, double chin, or neck skin folds

**It is only wise to start looking after your face from a very young age, instead of starting with damage-control when the signs of ageing have already started to show.**

## Face Lift & Neck Lift

With increasing age, the cheeks start to sag, the lips look more elongated and downturned. The neck folds and jowls make the face appear sad. The sagging of the face and neck can be corrected with a surgical lift or with non-surgical techniques like thread-lift.

The incision placement is such that the eventual scar is hidden around the ear. One may opt for a mini face-lift with a smaller incision, or a classical full face-lift depending upon the severity of the sagging of mid-face & jowls. It may not stop the ageing process but will make the face look a lot younger.

## Blepharoplasty (Eyelid surgery)

Earliest signs of ageing become visible in the eyes. The eyelids start to appear puffy and droopy, giving a tired and aged appearance. Eyelid surgery is a small day-care procedure that restores the youthful eyes.

## Brow-Lift

To restore or achieve elegant looking arched eyebrows. This can be combined with lateral canthal hitch to achieve the 'Cat-eye' look.

## Restoring the lost volume of the face

Facial fat grafting and stem cell therapy

Fillers to combat permanent lines, tear-trough deformity and for liquid facelift.

## Facial sculpting

### Cheek fat removal

To achieve more defined and sculpted cheeks. Performed under local anesthesia as a day-care procedure from inside the mouth, so it leaves no visible scars externally. Clients may go home the same day and resume daily activities.

### Facial slimming & Neck reshaping

Those who work out daily and follow strict dieting would know how difficult it is to get rid of excess fat from the face and under-chin area

Using finer cannulas from small holes, liposuction is carried out to remove excess fat from the face, neck and under-chin area to give it more defined and well-sculpted features.

### Facial implants

To augment the contours of prominent areas of face, such as Chin, Cheek, Jaw and Nose.

## Lip Surgeries

Shortening of upper lip (Lip lift)

Angle of lip lift

Lip thinning

Lip augmentation with fillers or fat transfer.
